01 — PROFILE

The engineer you call when the weld keeps cracking

Most of my work starts with a phone call about a part that will not behave. A weld that cracks on the fifth segment but not the first. An alloy the datasheet says is unweldable. A joint that has to survive 100,000 miles and a safety factor of three.

I graduated from Instituto Superior Técnico in Lisbon with an MSc in Mechanical Engineering, having first arrived at Carr's in February 2010 to run the welding trials for my thesis — in the workshop of the very company that then hired me. I joined as a graduate engineer in 2012 and am now **Technical Director and co-owner of CWT Group** — a precision laser welding subcontractor serving aerospace, automotive, EV battery, Formula 1, medical, oil & gas and tool engineering. In 2025 I completed a management buyout of the business alongside my two fellow directors.

What I bring is the whole chain, not one link of it: assessing weldability at quote stage, calculating the weld depth and profile a design actually needs, developing the laser parameters to achieve it, and then building the quality system that proves it — every time, to ISO 9001. When the

AT A GLANCE	
ROLE	Technical Director & co-owner — CWT Group
BOARD	Shareholder since November 2018; statutory director since September 2021; co-owner from October 2025

EDUCATION	MSc & BEng Mechanical Engineering — Instituto Superior Técnico, Lisbon
SPECIALISM	Laser welding & marking, weld metallurgy, weld strength analysis
STANDARDS	ISO 9001:2015 and ISO 14001 at CWT; AS9100D written and certified at Carr's Welding Products

existing technology could not reach far enough, I went and improved the technology itself, and published the results. Increasingly I focus on turning that engineering knowledge into systems other people can use reliably — documented methods, controlled processes, decision-support tools and software.

I am equally comfortable in front of a customer's engineering team, a conference audience, or a micrograph at 4000× magnification. The common thread is a diligent, methodical approach and a genuine enjoyment in explaining the *why* to whoever needs to hear it.

LANGUAGES	English (Cambridge CPE, C2) · Portuguese (native)
OFF THE CLOCK	Portuguese national triathlon champion, 2003. Since 2024, bladesmithing: heat-treating tool steel in a PID-controlled furnace at home, and a book for beginners in draft.

“The legacy I want to leave behind is a legacy of kindness and helpfulness — sharing what I have come to learn with people who will grow from it and become better engineers.”

PERSONAL MISSION

02 — CAPABILITIES

What I am usually brought in to do

Six areas where I take responsibility for the outcome — from the first weldability question on a drawing through to the certification pack that ships with the part.

Weldability & materials assessment

Evaluating whether a material and joint can be welded reliably — at quote stage, before anyone commits — and designing strategies around poor weldability rather than discovering it in production.

Alloy metallurgy

Hot & cold cracking

Dissimilar joints

Macro / micro analysis

Weld strength & design analysis

Calculating the weld depth and profile a design genuinely requires to hit its safety factor, and advising the customer at design stage — using SolidWorks, Cosmos and Ansys to prove it before cutting metal.

FEA — traction & torque

Safety factors

Joint redesign

Residual stress

Laser process development

Deriving the parameter set for every laser operation, guiding R&D programmes, assessing and procuring new technology, and training operators to run it. Including techniques that did not exist until we built them.

Disk & fibre lasers

Oscillating (wobble) welding

Ultrasonic-assisted

Parameter modelling

Quality systems & compliance

Writing, implementing and maintaining the management systems that let a subcontractor sell into aerospace and automotive — then running the audits, inspections and documentation that keep them credible. Running the system since 2013; twice-yearly management reviews signed by all directors.

ISO 9001:2015

ISO 14001

AS9100D (CWP)

PFMEA / PPAP

FAIR / CoFC / IR

Laser marking & engraving

Designing and running laser marking since 2014 — programming, fixture design, depth and contrast control on steels, aluminium and tooling, plus operator training and process support.

TruTops Mark

Deep engraving

Traceability marking

CNC programming

Operations & commercial strategy

Reading a business through its own data. Building the KPIs, spotting where turnaround time and non-conformance are quietly killing margin, and rebuilding the plan around what the numbers actually say.

KPI design

Power BI · Excel / VBA

PERT · CPM · Gantt

Workflow redesign

Engineering software I specify, direct and verify

I build engineering software when the tools I need do not exist. My part is the engineering: I define the problem, encode the domain knowledge, set the acceptance criteria, direct the implementation, and decide whether the output can be trusted on a real job. These are decision-support and controlled engineering tools, not products.

2013 → NOW

Laser Settings Predictor — Starting parameters for an unfamiliar job lived in my head and in old job sheets, so quoting a part nobody had welded before cost either my time or a guess. The tool encodes the relationship between material, thickness and target penetration depth as a calculation anyone can run at quote or setup stage. Built in Excel in 2013 and in use ever since. What it produces is a starting point to be proved on a coupon, not a qualified parameter set — the trial weld still decides. Now being ported to a standalone application so the method outlives the spreadsheet, and works without me in the room.

2026

WPS Database — Controlled engineering software for writing and issuing Welding Procedure Specifications to ISO 15609-4, built to take transcription and engineering risk out of a document that has to be right first time. The engineering is in the validation: acceptance criteria, units and ranges are checked against what the standard and the process actually permit, so a wrong number is caught at entry rather than on a live job. On a live procedure the validation caught a vacuum-leak acceptance criterion entered five times too loose, before the procedure was released. Offline by design as a customer-confidentiality control, and checked screen by screen to confirm nothing leaves the machine.

2026

KPI Dashboard — see Case 05.

Five problems, and what I did about them

Each one opens into the full engineering story — the context, the constraint, the method and the measured result. The micrographs and macros are from the actual samples.

Case 01

R&D

PEER-REVIEWED

ALUMINIUM AA6082

Making an “unweldable” aluminium alloy stronger with sound

AA6082 contains roughly 1% magnesium silicide, which makes it notoriously prone to hot cracking. The narrow parameter window that avoids cracking forces wide, deep welds — ruling out thin and heat-sensitive parts, and costing the business applications.

During the UltraMAT project, ultrasound was originally being used to disperse material within AA6082-based panels. I proposed applying the ultrasonic excitation during laser welding itself, to investigate whether it could improve weld behaviour — redirecting our part of the project toward ultrasonic-assisted laser welding.

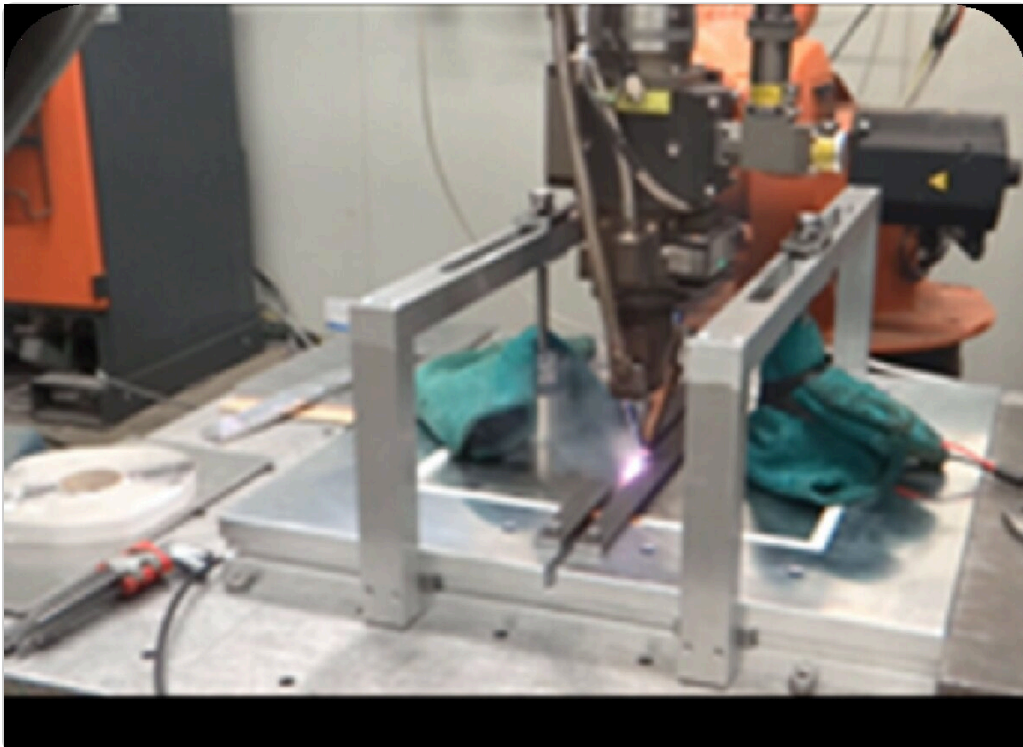

+10%

AVG UTS; +25% BEST TRIAL

14–62%STRAIGHTER WELD PROFILE,
REPORTED CONDITIONS**20–40 kHz**

BAND INVESTIGATED

Published in *Metals* and written up for *The Laser User*. It is now the basis of a proposal for high-volume automotive battery pack assembly.

ULTRASONIC-ASSISTED LASER WELDING TRIAL • AA6082

01 CONTEXT

My 2011 MSc thesis found a welding-speed window that let AA6082-T651 solidify without hot cracking. But aluminium's reflectivity meant reaching that window needed very high power density at a fixed beam diameter, and the slow speed produced welds that were wide and deep. Heat-sensitive and thin-walled applications were simply off the table — and every one of those was a job the company could not quote for.

02 THE IDEA

The casting industry has used mechanical vibration for decades to homogenise castings, applied over minutes to hours. Whether it does anything to a solidification event as fast as a laser weld was an open question. The candidate mechanism was ultrasonic grain refinement: vibration impacts, shocks and fluid flow acting as new nuclei and limiting grain growth.

03 METHOD

- Butt welding two 300 × 150 mm AA6082 plates at 1.5, 2 and 4 mm thickness.
- Transducers of varying power clamped to the workpiece, sonicating the plate during welding, melting and solidification.
- Discrete 28 kHz and 40 kHz transducers run at different power levels, within the 20–40 kHz band under investigation.
- Every trial run against a no-ultrasound baseline at identical laser settings.

04 EVIDENCE GATHERED

- Surface examination of the weld bead for microcracks and oxidation.
- Cross-section macros measuring weld depth, surface width and root width (aspect ratio).
- Reflected-light microscopy at ×200 for grain structure and dendritic growth.
- SEM at 4000× (BSD, 20 kV) for intermetallic morphology.
- Tensile testing to failure against the baseline.

05 THE EVIDENCE, SIDE BY SIDE

Left of the handle is the conventional laser weld. Right is the same weld with ultrasound applied. Same material, same laser settings.

FIG. 1 – WELD SURFACE

The centreline microcracking visible on the conventional weld, which acts as a crack initiation zone, is not present on the sonicated sample shown here. The plasma cloud is visibly reduced too — the ultrasonic waves stabilise the keyhole, so vaporised metal escapes without a pressure build-up.

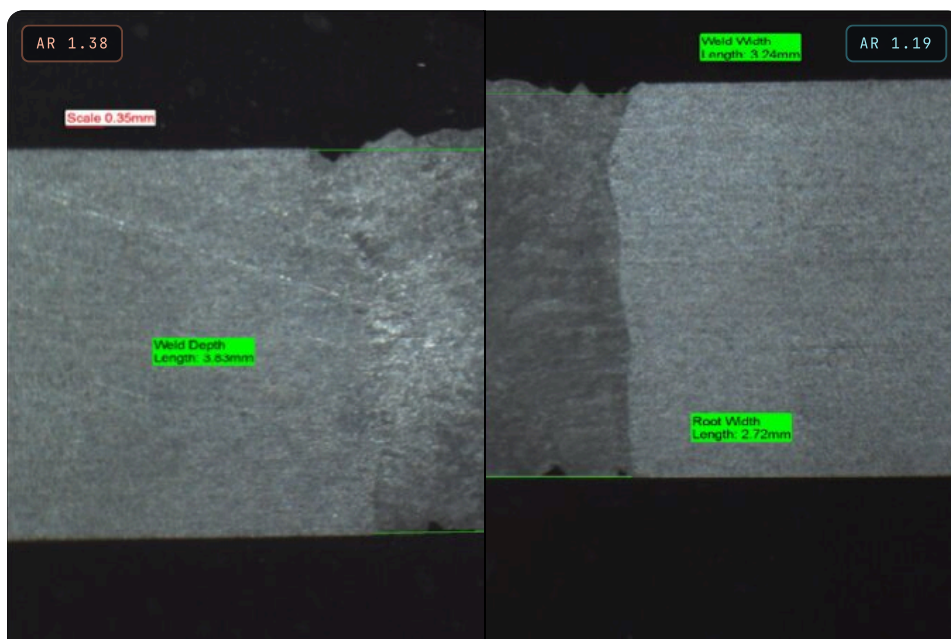

FIG. 2 – CROSS-SECTION & ASPECT RATIO

Aspect ratio is surface width divided by root width; closer to 1.0 means a straighter, more parallel-sided weld. Ultrasound took it from 1.38 to 1.19 on this coupon. Across the reported experimental conditions the improvement ranged from 14% to 62%, with 40 kHz best on thin plate and 28 kHz best at 4 mm.

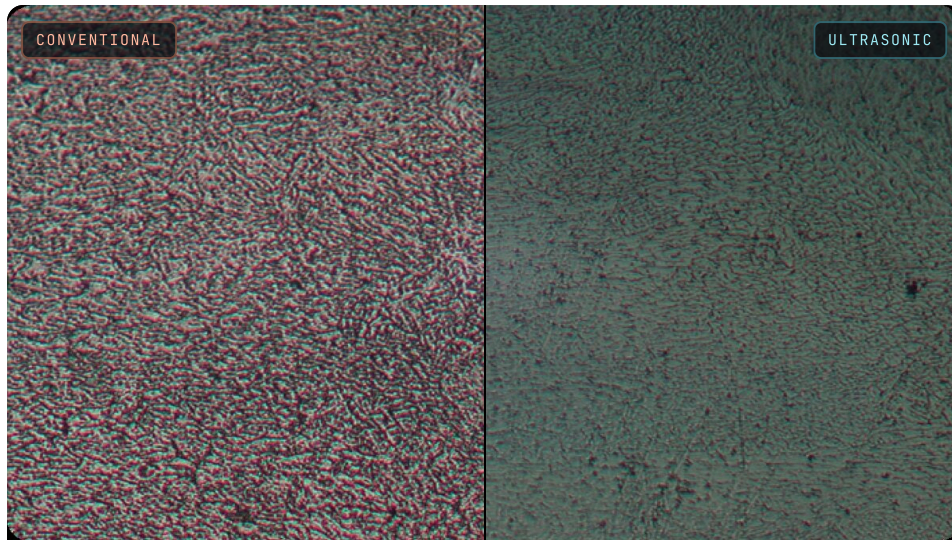

FIG. 3 – GRAIN STRUCTURE, *200

The conventional weld shows dendritic growth in several locations and an unevenly distributed grain structure, with grains crowding around the dendrites. With ultrasound there are no agglomerations, the structure is even, and the only denser region is where two solidification fronts meet.

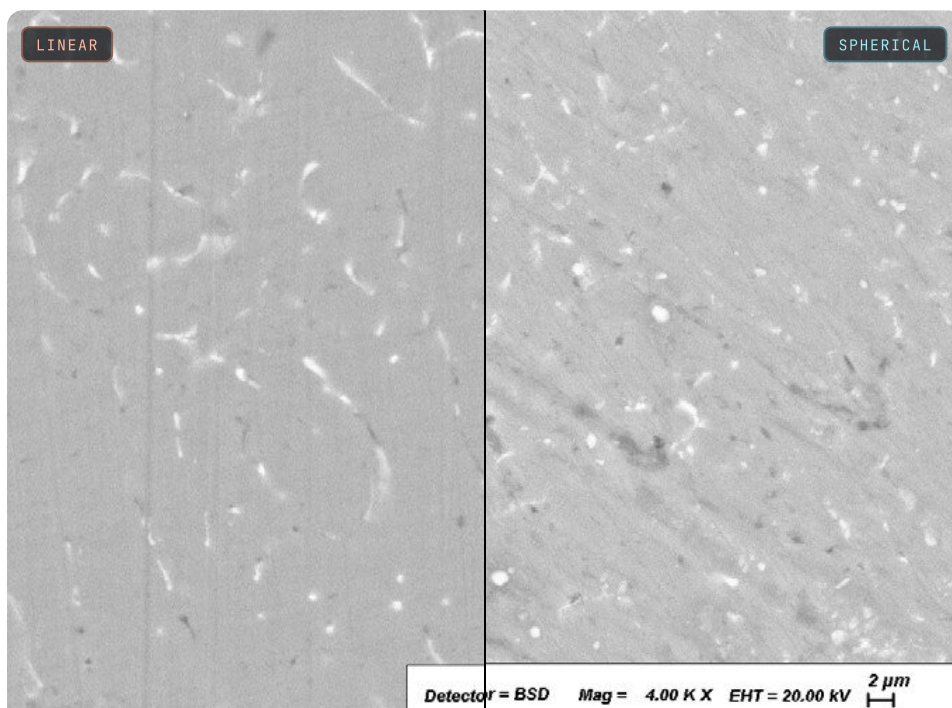

FIG. 4 – INTERMETALLICS, SEM 4000× (BSD, 20 KV)

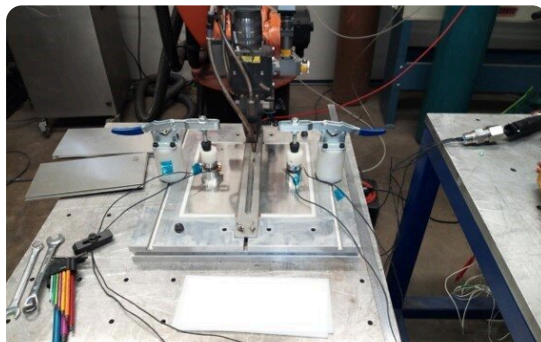

This is the finding that matters most. Without ultrasound the intermetallic compounds form long linear structures — textbook crack initiators. With ultrasound they are smaller and largely spherical, which resist crack initiation far better. That change in morphology accompanied the measured strength increase.

06 RESULTS

MEASURE	CONVENTIONAL	ULTRASONIC- ASSISTED	CHANGE
Ultimate tensile strength — study average	baseline	+10%	▲ consistent across trials
Ultimate tensile strength — best trial	baseline	+25%	▲ 80 W, 28 kHz, 25 mm/s
Weld profile straightness (aspect ratio)	AR 1.38	AR 1.19	▲ 14–62% across the reported conditions
Centreline indication	visible	not observed	▲ in the sonicated samples of the published comparison
Intermetallic morphology	linear	spherical	▲ fewer crack initiators
Plasma cloud & spatter	baseline	reduced	▲ improved keyhole stability

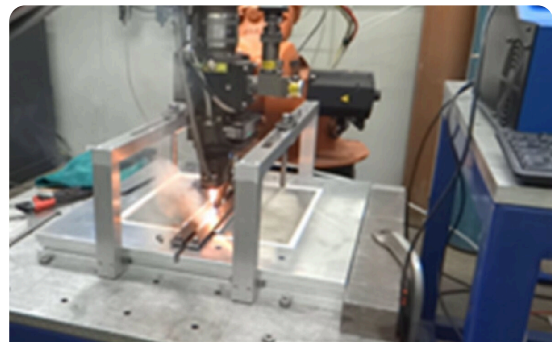

Cavitation was identified as a likely significant contributor. Collapsing bubbles generate local forces strong enough to break chemical bonds and raise local temperatures towards 10,000 K; bubble growth and collapse take roughly 1 ms and 150 μ s respectively, so those forces can act even under a rapidly moving laser spot. The calculated cavitation threshold was exceeded at the antinodes. Further modelling was proposed to confirm the role it plays.

07 THE RIG AND THE PROCESS

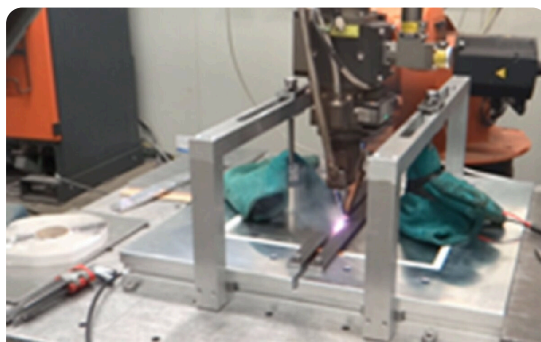

TEST RIG

Transducers bonded to the plate, under a robot-mounted laser head.

BASELINE

Welding without ultrasound — larger plasma plume.

WITH ULTRASOUND

Stabilised keyhole, reduced plasma and spatter.

Peer-reviewed and published as *Improvements in the Microstructure and Mechanical Properties of Aluminium Alloys Using Ultrasonic-Assisted Laser Welding in Metals* 12(6):1041 (2022), and written up for the AILU membership in *The Laser User*, Issue 106. I presented the concept at UltraMAT open days in 2019 and 2020, and took it to ILAS in March 2023 as *Soni-Laser* — a route to high-volume assembly of automotive battery packs. Both UltraMAT (2017) and Soni-Laser (2022) were Innovate UK-funded collaborative projects.

Brunel Innovation Centre provided the ultrasonic expertise and equipment. At CWT I led the welding work, trial planning and macro analysis; tensile testing was carried out independently by TISICS.

Read the paper (<https://doi.org/10.3390/met12061041>)

Case 02 **FEA** **AUTOMOTIVE** 25CRM04 / AISI 4130

Stopping transverse cracking in a segmented clutch-drum weld

A customer's clutch drum for an armoured executive vehicle had to survive a minimum of 100,000 miles under extreme conditions at a safety factor of 3.0. The first five weld segments went in cleanly. The next five cracked. I was asked to determine the weld profile that would actually hold — and why the existing one was failing.

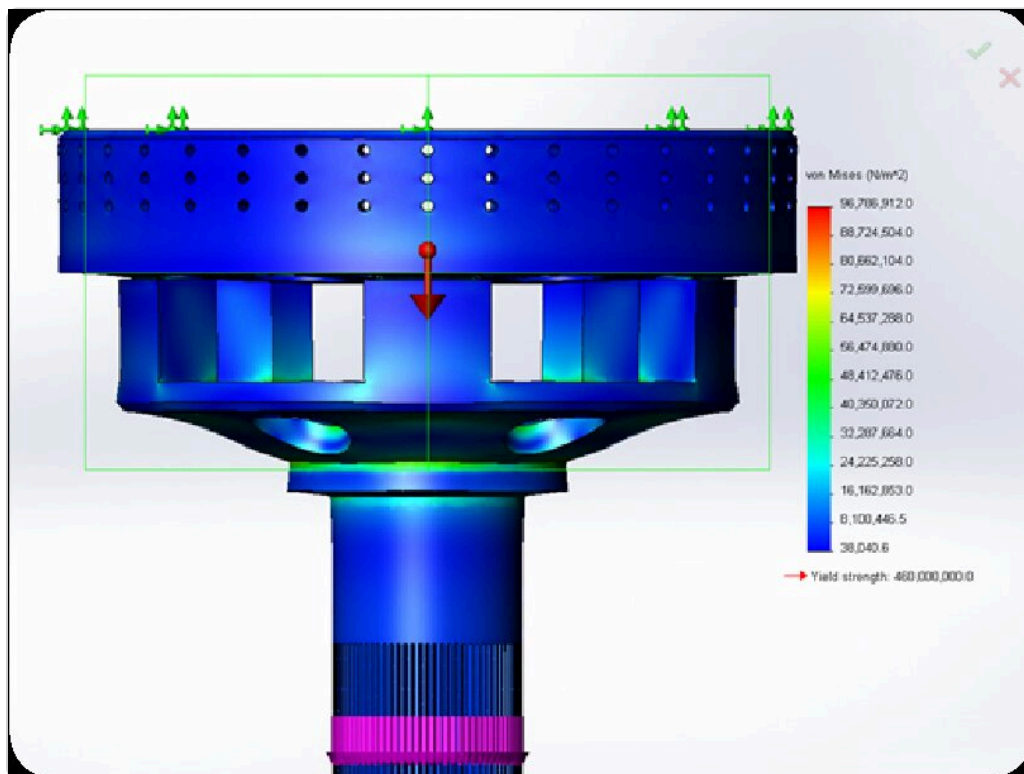

3.0

SAFETY FACTOR REQUIRED

100k

MILES SERVICE LIFE

The corrected process ended the cracking, met the customer's requirement, and brought in an influx of similar work from them and their partners.

FEA TRACTION STUDY • VON MISES STRESS

01 THE PROBLEM

The top surface carried two distinct weld zones — five segments on an outer diameter and five on an inner. In theory that is unremarkable, and the first five went in without issue. The second five produced **transverse cracking** in the earlier welds: cracks running perpendicular to the weld direction, the signature of longitudinal residual stress. The initial welds also showed material contracting away from the centreline, the mark of low-melting-point constituents such as iron sulphites.

02 WHAT HAD TO BE ESTABLISHED

- The **minimum permissible weld depth** — weld size drives residual stress, so oversizing the weld was itself part of the problem.
- The **weld sequence** that minimises accumulated thermal stress across ten segments.
- The **laser parameters** that produce a weld profile able to resist cooling stresses.

03 MODEL & ASSUMPTIONS

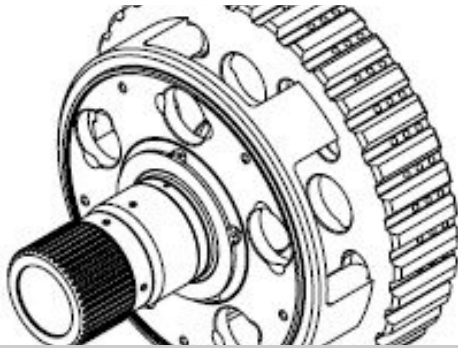

Material	25CrMo4 (AISI 4130)
Geometry	Assembly modelled in SolidWorks as a solid , simulating a fully welded joint
Inner weld	3 mm solid
Traction study	Top surface of the drum edge pinned; 5,000 N applied to the shaft to simulate shear on the welds
Torque study	Drum side surface pinned; 500 N·m applied to the shaft
Solvers	Cosmos and Ansys

04 OUTCOME

The traction and torque analyses located the zones prone to the highest stress and established that a **3 mm weld depth** was sufficient for the load case. That answered the structural question: the weld did not need to be larger.

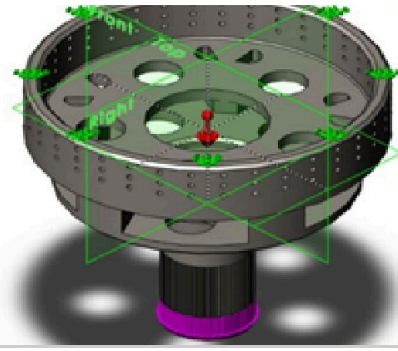

The cracking was a separate, metallurgical problem. A distinct process investigation into weld sequence, heat input and the low-melting-point constituents in the parent material produced the revised welding approach that stopped it.

Field testing by the customer exceeded their expectations. The assembly has been in service since **2015**, and the work led directly to more of the same from that customer and their supply chain partners.

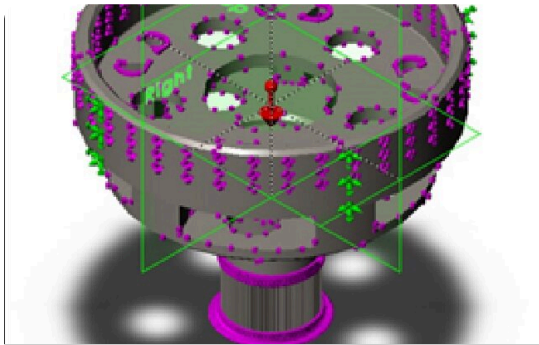

ASSEMBLY

Modelled in SolidWorks as a solid.

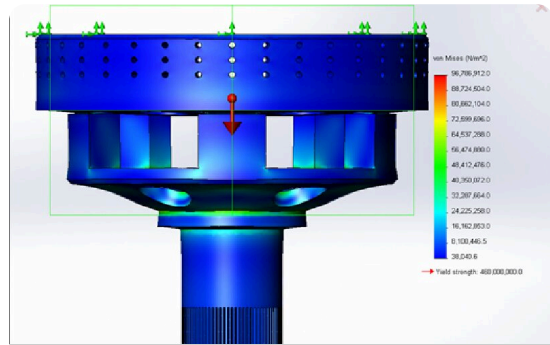

TRACTION SET-UP

Edge pinned, 5,000 N on the shaft.

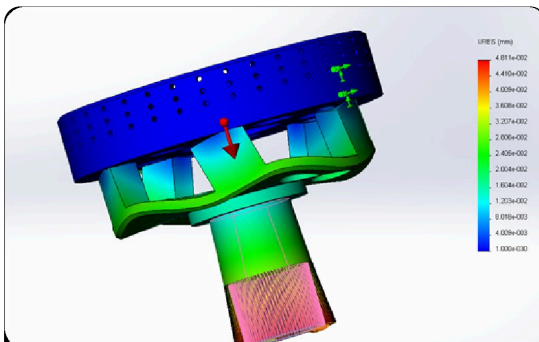

TORQUE SET-UP

Side pinned, 500 N-m on the shaft.

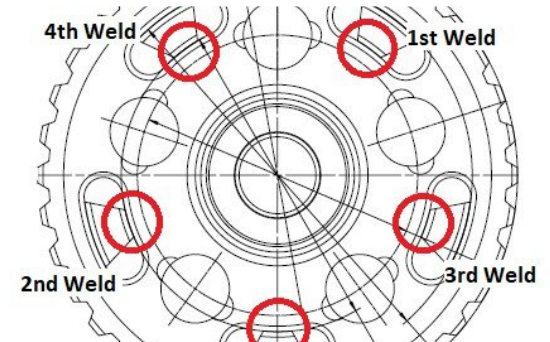

TRACTION RESULT

von Mises distribution under 5,000 N.

TORQUE RESULT

Confirmed 3 mm weld depth was adequate.

WELD SEQUENCE

Ordered to minimise thermal stress.

ACHIEVED PROFILE

Macro of a representative weld coupon.

Diagnosing a decline, then rebuilding the process behind it

A large two-year production contract had pulled the company's focus away from production and into tooling repair — a reactive market that is hard to plan around — and nothing had been put in place to replace the revenue when it ended. FY2017 is the low point in the ledger. That year the company went through a management restructure: Alistair Houghton became General Manager, and I took on more of the technical, quality and business-improvement work. We addressed the operational causes together.

~£600k

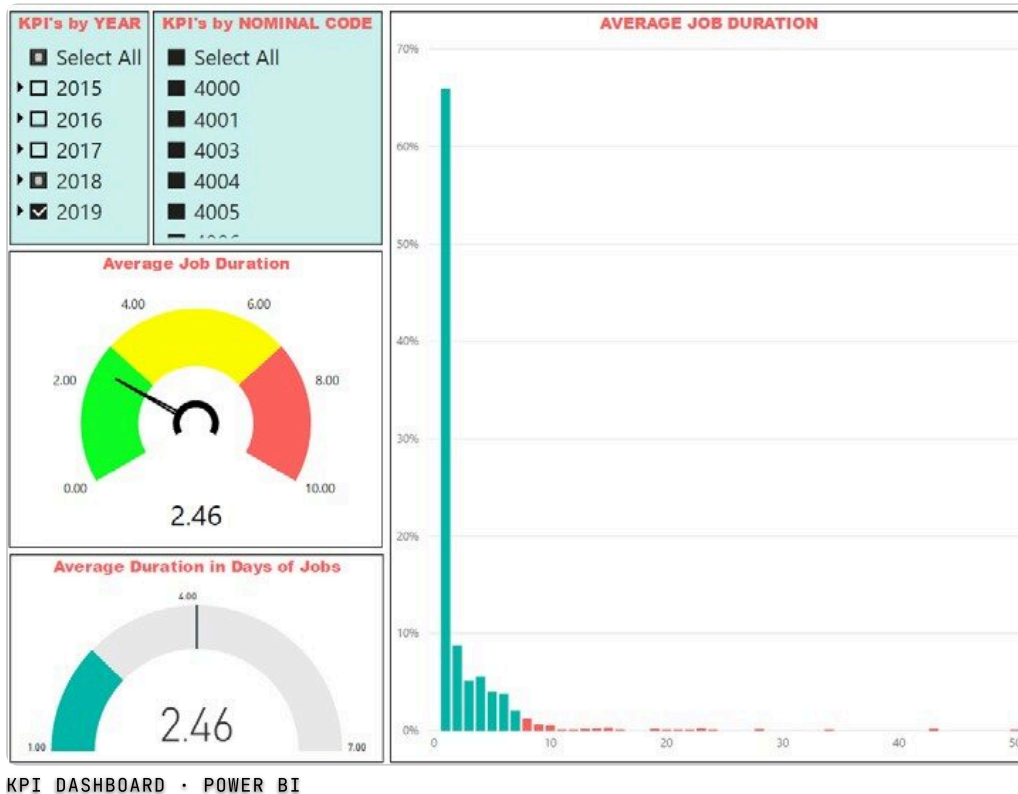

FY2017, THE LOW POINT

~£1.84m

FY2026

Internal Sage ledger, nominal 4000–4999, identified non-trading income excluded. Statutory turnover may differ because of year-end journals.

Turnaround time, non-conformances and monthly revenue. Fix those three and the rest followed. Turnover recovered from the FY2017 low, and the management team went on to own the company.

01 THE COMMERCIAL REALITY

A firm supplying a niche service like laser welding survives on two things: it has to add real value to the goods passing through it, and it has to hold a healthy customer base. Added value depends on the workforce and the technology. The customer base depends on part quality, turnaround time, and whether customers are willing to recommend you.

In 2012 a large two-year production job shifted the whole business's focus. When it foreseeably ended, there was no plan to replace it, so the company drifted into tooling repairs — reactive work that is extremely hard to plan around. Less capital came in, profitability fell, and the trend was clearly unsustainable.

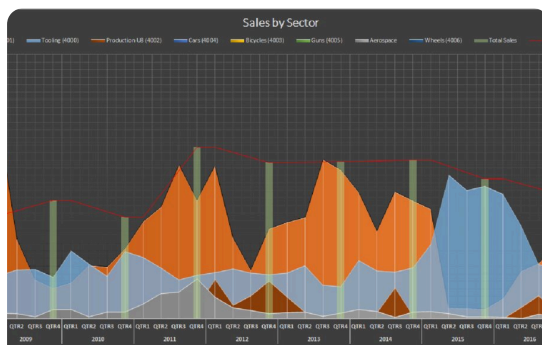

02 INSTRUMENTING THE BUSINESS

Before proposing anything I built the measurements. I designed a set of KPIs to establish the current state and the trend, using Excel for the analysis and Power BI for the data manipulation and dashboards. Three measures turned out to carry the signal:

- **Turnaround time per application**
- **Non-conformances raised**
- **Monthly revenue**, segmented by sector

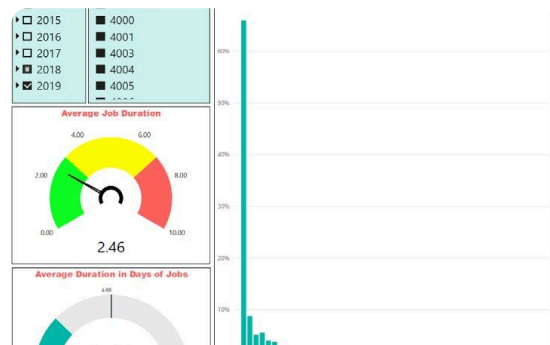

03 WHAT THE DATA SAID

Turnaround time per application was excessively long, and the non-conformance count was high. Together those two accounted for much of the customer attrition — customers were waiting too long and receiving parts they had to question. Neither problem needed capital expenditure to fix. They needed process.

SALES BY SECTOR

The shape of the problem, over time.

KPI DASHBOARD

Average job duration by year and code.

REVENUE VS TARGET

Monthly tracking of the recovery.

04 WHAT I CHANGED

- Wrote formal **working procedures** for daily production and welding activity.
- Introduced additional **inbound and outbound quality control**.
- Ran **staff training built around a quality culture** — stopping cross-contamination, and setting an explicit zero-defect target rather than an acceptable rejection rate.
- Shifted the business focus back to **production**, now underpinned by a quality culture that genuinely added value to the welding service.

05 RESULTS

- Customer numbers increased, and existing customers began **referring the company to their partners**.
- Turnover **more than tripled** from the FY2017 low by FY2026.
- The multi-year sales decline was **fully reversed**.
- I became a **shareholder** in November 2018.
- The recovery held. In 2025 I completed a **management buyout** of the company alongside my two fellow directors — the strategy I wrote in 2016 is now the business I co-own.

Case 04

CRAFT

SINCE 2014

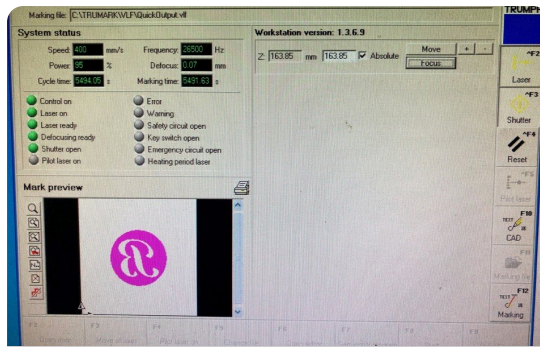

MARKING & ENGRAVING

Laser marking and deep engraving, programmed and proven

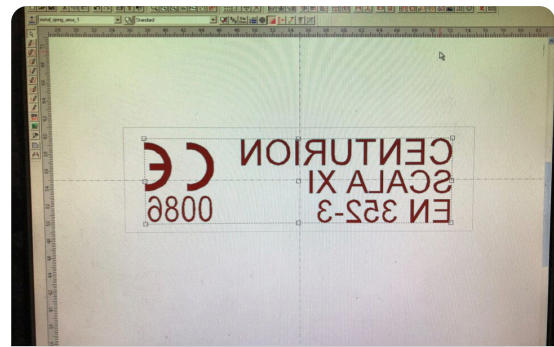

Designing and operating laser markers since 2014 — programming, fixturing, and dialling in depth and contrast across tool steels, aluminium and stainless. Traceability codes, certification marks, branding and deep engraving on production tooling, plus the operator training and process support that keeps it repeatable.

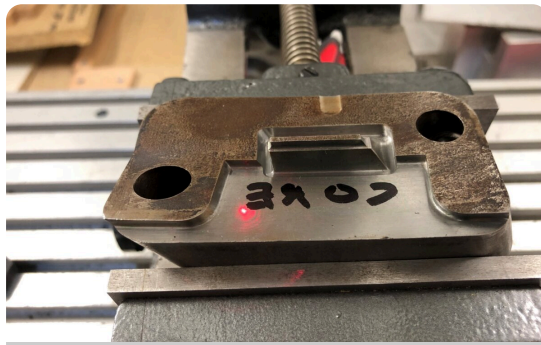

DEEP ENGRAVING • TOOLING INSERT

**PROGRAMMING**

Parameters set in TruTops Mark before firing.

**ARTWORK PREP**

Mirrored text for a mould insert.

**SET-UP**

Clamped and aligned, pilot beam confirming position.

**RESULT**

Consistent depth, clean character walls.

**IN PROGRESS**

Circular component being traced in the fixture.

**CERTIFICATION MARKS**

Standard, notified body and part identity.

**CONTRAST MARKING**

Legibility through parameters, not depth.

Instrumenting the business, ten years on

Case 03 was built in Excel and Power BI in 2016. By 2026 the business was three times the size, the auditor's report named the KPI spreadsheets by hand, and every number still ran through me. So I replaced them with an application the company could run without me: a desktop KPI dashboard that imports directly from the accounts ledger, measures the three things that matter, and forecasts the year ahead.

91%

ACHIEVED · 85% TARGET —
JOBS CLOSED WITHIN FIVE
WORKING DAYS

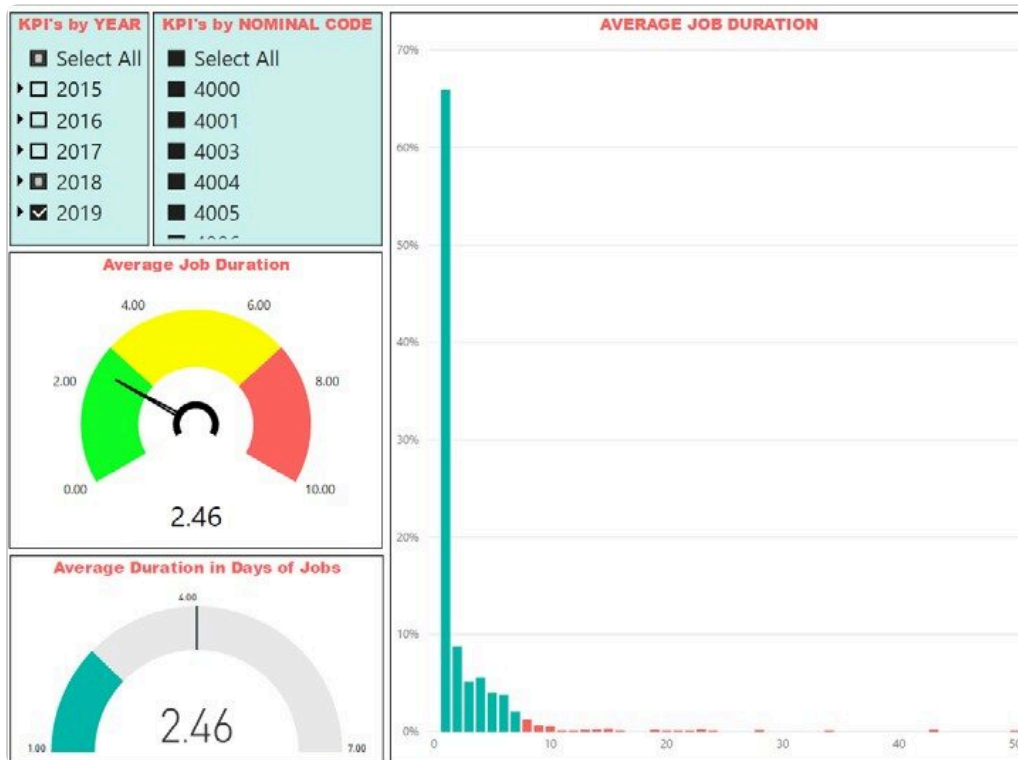

±1.5%

FORECAST ACCURACY IN STABLE
YEARS, ROLLING-ORIGIN
BACKTEST

-19%

ENERGY PER UNIT OF SALES,
YEAR ON YEAR (ISO 14001)

Built for the December 2026 surveillance audit. Management review now runs on it.

PREDECESSOR DASHBOARD, 2016 — REPLACED BY THE APPLICATION DESCRIBED HERE

01 WHAT IT REPLACED

Three Excel pivot dashboards — sales analysis, job completion and non-conformance analysis — maintained by hand and cited by name in the auditor's December 2025 report. Twenty-six years of invoice history and eleven years of nominal-ledger data, imported from Sage exports.

02 WHAT IT MEASURES

Eleven views: sales against target, turnaround SLA, profit and loss, non-conformances with effectiveness review, energy intensity, calibration register, forecast, reports, imports, settings, home.

Turnaround now reports the share of jobs closed within five working days: 91% achieved against a formal 85% target. The earlier measure had been an average of jobs falling between three and five days, with no target at all. Setting the target required documenting which orders count — framework and paused orders are excluded, and the exclusion is recorded.

03 FORECASTING

Holt-Winters exponential smoothing with additive seasonality and damped trend, trained on monthly invoiced sales since 2010. Validated by a three-year rolling-origin backtest: projected annual totals landed within $\pm 1.5\%$ of actuals in the two stable years. The step-change year was under-forecast by 28% — which the method reports rather than hides.

04 ENGINEERING

Built in Python on a local SQLite database imported from the Sage exports, and issued in two forms — a Writer for whoever maintains it, and a read-only Viewer, so colleagues see the same numbers without being able to change them. Two automated validators have to pass before a release goes out. First installed on a second machine in August 2026, which was the point of the exercise: the numbers no longer run through me.

His diligent and methodical approach to problem solving has frequently been a calming influence on our workforce when things aren't going to plan.

Written in support of my application for chartered status, the letter describes a cold cracking problem in gear-to-shaft welds that was not occurring for the normal metallurgical reasons. I traced it to the composition of the shaft material, redesigned the joint to use a filler pass with a specific grade of wire chosen to counteract that metallurgy, modelled and proved the change, and presented the solution to the customer — gaining approval throughout the supply chain and saving the project.

Alistair Houghton

General Manager, Carr's Welding Technologies Ltd — February 2020

Written when Alistair was my manager. We went on to buy the company together, and he is now my co-owner — so read it as the view of someone who backed his own judgement with his own money, not as an independent reference.

Published, peer-reviewed, and presented

When the available technology could not do what customers needed, the answer was to research a better one — and then to share it, in journals, trade press and from the front of the room.

From thesis trials to co-owner

I first walked into Carr's Welding Technologies in February 2010, to run the welding trials for my thesis. Today I set the company's technical direction and co-own it.

SEP 2021 - PRESENT

Technical Director & Co-owner

CWT Group · Kettering, UK · cwt-group.com (<https://cwt-group.com>)

Shareholder since November 2018; statutory director since September 2021; co-owner from October 2025.

Trading name of Carr's Welding Technologies Ltd (no. 03921135) since the September 2025 rebrand.

TECHNICAL

- Evaluate material weldability at quote stage and develop strategies that minimise welding issues in materials with poor weldability.
- Calculate weld strength at design stage and advise customers on the weld depth and profile their part actually requires.
- Advise customers on the right welding technology for their application, and design new or improved parts to suit.
- Calculate the parameters for every laser operation; assess and procure new technology.
- Guide every R&D project — strategy, parameters and welding method — through to the required outcome.
- CNC technical support and training; laser marking programming, support and training.

QUALITY

- Produce the production and welding procedures used in daily work.
- Run internal audits and maintain the quality management system to ISO 9001:2015, with controls kept beyond the minimum the standard requires.
- Carry out all quality inspections: visual, dye penetrant, helium leak, macro and micro analysis.
- Issue certificates of conformance, inspection reports and first article inspection reports.
- Improve process quality using PFMEA and PPAP for automotive and aerospace customers.
- Build and maintain the company's stock control and KPI calculation software.
- Identify non-conformances and develop corrective actions that stop them recurring.

KEY ACHIEVEMENTS

Developed a program that calculates welding parameters from customer requirements. Worked with the General Manager to change the profile and strategy of the company's business plan and carry the workforce with it, as turnover recovered from the FY2017 low. Responsible for the content and redesign of the company website.

APR 2013 — AUG 2021

Quality & Technical Manager

Carr's Welding Technologies Ltd · Kettering, UK — now trading as CWT Group

SCOPE

- All quality and technical assurance across a business serving aerospace, automotive, pharmaceutical, Formula 1, oil & gas, naval and tool engineering.
- Created and maintained the KPIs the business is still measured on.
- Improved daily workflow using PERT, Critical Path Method and Gantt planning.

ALSO

- Coached the workforce on best welding practice.
- Created key company documents — employee handbook, contracts, customer registration forms, training matrix.
- Created and implemented the ISO 14001 environmental management system in 2021.

RECOGNITION

Became a shareholder in November 2018, after the 2017 management restructure and the recovery work that followed — the first step towards co-ownership in 2025.

JUN 2014 — NOV 2018

Quality & Technical Manager — CONCURRENT

Carr's Welding Products Ltd · Kettering, UK — aerospace & automotive (sister company; ceased trading 2018; dissolved May 2019)

RESPONSIBILITIES

- In charge of all quality and technical assurance for the sister company.
- Responsible for elevating its quality management system to AS9100.
- Planned strategies to improve production workflows; created and maintained KPIs.

ACHIEVEMENT

- Created new ways of working by planning production workflows and applying project management tools — including the spreadsheet systems that made the quality management system uplift possible.

MAR 2012 — MAR 2013

Technical & Quality Engineer

Carr's Welding Technologies Ltd · Kettering, UK

HOW IT STARTED

- Recruited on graduation, by the owner of the company whose equipment I had just spent my master's research on.
- Brought in specifically to raise the company's quality level — the brief that shaped everything that followed.

WHERE IT LED

- Promoted to Quality & Technical Manager within a year.
- This is where my career as a mechanical engineer began, and where the pursuit of a meaningful impact on the laser welding industry started.

FEB — MAR 2010

MSc thesis welding trials

Carr's Welding Technologies Ltd · Kettering, UK

WHERE IT ALL BEGAN

- Came over from Instituto Superior Técnico to run the practical trials for my MSc thesis, begun in Lisbon the previous September: laser welding of aluminium alloy AA6082 — the crack-prone alloy I have been chasing ever since.
- Those trials became my thesis, then my first job, then the ultrasonic research, and eventually the company itself.

Qualifications, standards and toolset

Formal education in Lisbon, standards implemented in Kettering, and the software I actually use week to week.

EDUCATION

MSc Mechanical Engineering

Instituto Superior Técnico, Universidade Técnica de Lisboa

MAR 2007 — JAN 2012

Thesis: *Laser Welding of Aluminium Rings - Autogeneous Welding of Aluminium Alloy AA6082-T651*, published 31 May 2011; experimental work carried out at Carr's Welding Technologies Ltd. Investigated porosity and hot cracking in AA6082-T651 and demonstrated viable autogenous welding without filler or pre/post-weld heat treatment. Highest grade in the year for Heat Transfer.

BEng Mechanical Engineering

Instituto Superior Técnico, Universidade Técnica de Lisboa

SEP 2003 — SEP 2007

Honourable mention in the SolidWorks 2004 International Contest for the project "Monster Truck".

Also: Certificate of Proficiency in English (Cambridge, 2004) — CEFR level C2.

STANDARDS & ASSURANCE

- ✓ **AS9100D** — wrote the complete QMS for Carr's Welding Products, an aerospace welding business, prepared the assessments and took the system through to certification. That company ceased trading in 2018; dissolved May 2019. Many of its controls were carried into CWT, which is certified to ISO 9001, not AS9100.
- ✓ **ISO 9001:2015** — quality management. Implemented, maintained, internally audited.
- ✓ **ISO 14001** — environmental management. Created and implemented in 2021.
- ✓ **Recertification, December 2025** — ISO 9001:2015 and ISO 14001:2015, two-day external audit: zero major, zero minor non-conformances, one opportunity for improvement.
- ✓ **Welding procedure standards** — WPS authored to ISO 15609-4; weld quality levels to EN ISO 13919-1 and -2; procedures qualified by customer examination and approval under EN ISO 15611; visual inspection to EN ISO 17637.
- ✓ **Records** — quality records retained 10 years for standard customers and 30+ years for aerospace; paper originals are the retained record.
- ✓ **PFMEA & PPAP** — automotive and aerospace process quality.
- ✓ **FAIR, CofC, IR** — first article inspection reports, certificates of conformance, inspection reports.
- ✓ **Inspection methods** — visual, dye penetrant, helium leak testing, macro and micro analysis.
- ✓ **Project control** — PERT, Critical Path Method, Gantt planning.

CORE COMPETENCIES

Laser welding & process development

Continuous production laser welding practice since 2012; process development work on ultrasonic assistance published in *Metals* (2022).

Weld metallurgy & weldability

MSc thesis on porosity and hot cracking in AA6082-T651; day-to-day work on alloys and joints customers have been told cannot be welded.

Quality management systems

Wrote AS9100D at Carr's Welding Products and ISO 9001 and ISO 14001 at CWT, each taken through to certification; December 2025 recertification closed with zero non-conformances.

Laser marking & CNC programming

Fibre and disk laser platforms programmed for production marking and welding, including TruTops Mark and oscillating (wobble) welding.

Mechanical design & FEA

Fixture and component design in SolidWorks; Ansys used to check specific load cases, including the clutch-drum weld in Case 02.

Project & production management

Technical direction and production scheduling for a subcontract shop serving aerospace, automotive, EV battery, Formula 1, medical, oil & gas and tool engineering.

Data analysis & KPI reporting

In-house Python and SQLite tooling with Power BI reporting, used for live production and quality KPIs.

07 — CONTINUOUS DEVELOPMENT

Still learning, deliberately

A formal CPD record, and the vendor assessments, workshops and industry events behind it, across the UK, Germany, Austria, Ireland and the USA. The talks I gave are listed under Research & speaking.

Continuous professional development

15 records • 2021-2023

Jan — Apr 2021 • Course

100 Days of Python Bootcamp, Udemy. Learnt to program in Python and built my own portfolio website.

Feb 2021 • Course

Marketing with LinkedIn Masterclass.

Mar 2021 • Podcast

TWI Innovation Network Podcast, Episode 4. Shared my view on where AI and cobots could take the welding industry.

Apr 2021 · Work-based

IPG oscillating laser welding training. Operating and programming the newest oscillating laser welding technology.

Aug 2022 · TWI webinar

An introduction to numeric modelling at TWI.

Aug 2022 · TWI webinar

The fatigue performance of welded joints — a refresher.

Sep 2022 · TWI webinar

Damascus steel in legend and reality.

Sep 2022 · NQA webinar

ISO 14001 — back to basics.

Oct 2022 · TWI webinar

Back to basics — cracking in ferritic steels.

Nov 2022 · NQA webinar

ISO 27001 — back to basics.

Nov 2022 · TWI webinar

Failure analysis — methodology, techniques and case studies.

Dec 2022 · TWI webinar

NDT of additively manufactured components.

Jan 2023 · NQA webinar

ISO 9001 — internal auditing.

May 2023 · Struers webinar

Materialographic preparation of titanium and titanium alloys.

Jun 2023 · TWI webinar

Back to basics — engineering critical assessment.

Events attended

2014–2019 · attended

2014–19	Laser technology assessments — TRUMPF, Stuttgart (Feb 2014, Jul 2014, Jul 2015, May 2016); IPG Lasers oscillating laser welding workshop and trials, Boston (Feb 2016); Alpha Laser, Puchheim (Nov 2019)
2014	Magna Steyr, Austria — laser setup and training (May), and setup, training and process approval (Sep)
2017–18	Industry meetings — ILAS 2017, the 5th Industrial Laser Applications Symposium (Mar 2017); AILU Jobshop annual meetings at BOC (Oct 2017) and Bystronic (Nov 2018); MedTech Medical Technology, Galway (Oct 2017)
2016–19	Advanced Engineering Show, NEC — 2016, 2017, 2018 and 2019

Milestones

2003 – 2026

2003	Portuguese National Triathlon Champion
2013	Built a program that calculates laser settings from customer requirements
2013	Began compiling the AS9100 QMS for Carr's Welding Products Ltd
2017	Management restructure; began the operational and quality work behind the recovery
2018	Became a shareholder in Carr's Welding Technologies Ltd (November)
2019	Proposed and led CWT's ultrasonic-assisted laser welding trials on the UltraMAT project
2021	Created and implemented the ISO 14001 EMS for Carr's Welding Technologies Ltd

2022	Published in <i>Metals</i> — ultrasonic-assisted laser welding of aluminium alloys
2022	Feature article published in <i>The Laser User</i> , Issue 106
2025	Company rebranded as CWT Group (September)
2025	Became co-owner alongside two fellow directors (October)
2025	Recertified to ISO 9001:2015 and ISO 14001:2015 with zero non-conformances (December)
2026	KPI dashboard application deployed, replacing the 2016 spreadsheets
2026	WPS Database issued as controlled software for writing welding procedures to ISO 15609-4
2026	Turnover more than three times the FY2017 low (internal ledger, year to April)

08 — CONTACT

Got a part that won't weld?

Whether it is a weldability question on a drawing, a joint that keeps failing, a quality system that needs to reach AS9100D, or a research collaboration — I would be glad to talk it through.
